## Introduction to Machine Learning – exercise 2:

1.

a. Let  $w_i$  be the i'th weight vector of size d out of the columns of a weight matrix

$$P(Y = i|X = x_t) = \frac{e^{w_i x_t + b_i}}{\sum_{j=1}^k e^{w_j x_t + b_j}}$$

b. Let  $y_t$  be a number between 1 to k

$$L(w;b) = -ln\left[\prod_{t=1}^{m} P(Y = y_t | X = x_t)\right] = -\sum_{t=1}^{m} ln\left[\frac{e^{w_{y_t}x_t + b_{y_t}}}{\sum_{j=1}^{k} e^{w_j x_t + b_j}}\right] = -\sum_{t=1}^{m} ln\left[\frac{e^{w_{y_t}x_t + b_{y_t}}}{\sum_{j=1}^{k} e^{w_j x_t + b_j}}\right] = -\sum_{t=1}^{m} ln\left[\frac{e^{w_{y_t}x_t + b_{y_t}}}{\sum_{j=1}^{k} e^{w_j x_t + b_j}}\right] = -\sum_{t=1}^{m} ln\left[\frac{e^{w_{y_t}x_t + b_{y_t}}}{\sum_{j=1}^{k} e^{w_j x_t + b_j}}\right] = -\sum_{t=1}^{m} ln\left[\frac{e^{w_{y_t}x_t + b_{y_t}}}{\sum_{j=1}^{k} e^{w_j x_t + b_j}}\right] = -\sum_{t=1}^{m} ln\left[\frac{e^{w_{y_t}x_t + b_{y_t}}}{\sum_{j=1}^{k} e^{w_j x_t + b_j}}\right] = -\sum_{t=1}^{m} ln\left[\frac{e^{w_{y_t}x_t + b_{y_t}}}{\sum_{j=1}^{k} e^{w_j x_t + b_j}}\right] = -\sum_{t=1}^{m} ln\left[\frac{e^{w_{y_t}x_t + b_{y_t}}}{\sum_{j=1}^{k} e^{w_j x_t + b_j}}\right] = -\sum_{t=1}^{m} ln\left[\frac{e^{w_{y_t}x_t + b_{y_t}}}{\sum_{j=1}^{k} e^{w_j x_t + b_j}}\right] = -\sum_{t=1}^{m} ln\left[\frac{e^{w_{y_t}x_t + b_{y_t}}}{\sum_{j=1}^{k} e^{w_j x_t + b_j}}\right] = -\sum_{t=1}^{m} ln\left[\frac{e^{w_{y_t}x_t + b_{y_t}}}{\sum_{j=1}^{k} e^{w_j x_t + b_j}}\right] = -\sum_{t=1}^{m} ln\left[\frac{e^{w_{y_t}x_t + b_{y_t}}}{\sum_{j=1}^{k} e^{w_j x_t + b_j}}\right] = -\sum_{t=1}^{m} ln\left[\frac{e^{w_{y_t}x_t + b_{y_t}}}{\sum_{j=1}^{k} e^{w_j x_t + b_j}}\right] = -\sum_{t=1}^{m} ln\left[\frac{e^{w_{y_t}x_t + b_{y_t}}}{\sum_{j=1}^{k} e^{w_j x_t + b_j}}\right] = -\sum_{t=1}^{m} ln\left[\frac{e^{w_{y_t}x_t + b_{y_t}}}{\sum_{j=1}^{k} e^{w_j x_t + b_j}}\right] = -\sum_{t=1}^{m} ln\left[\frac{e^{w_{y_t}x_t + b_{y_t}}}{\sum_{j=1}^{k} e^{w_j x_t + b_j}}\right]$$

$$\sum_{t=1}^{m} \left[ ln(\sum_{j=1}^{k} e^{w_{j}x_{t}+b_{j}}) - \ln(e^{w_{yt}x_{t}+b_{yt}}) \right] =$$

$$\sum_{t=1}^{m} \left[ ln(\sum_{j=1}^{k} e^{w_{j}x_{t}+b_{j}}) - w_{y_{t}}x_{t} - b_{y_{t}} \right]$$

$$\sum_{t=1}^{k} \left[ \ln(\sum_{j=1}^{k} e^{w_j x_t + b_j}) - w_{y_t} x_t - b_{y_t} \right]$$

hence the expression we seek is (where w is a matrix):

$$argmin_{w}\left(\sum_{t=1}^{m}\left[ln\left(\sum_{j=1}^{k}e^{w_{j}x_{t}+b_{j}}\right)-w_{y_{t}}x_{t}-b_{y_{t}}\right]\right)$$
The undetermine of the unique vector of class letting as

- c. The update rule of the weight vector of class l at time s would be  $w_1^s = w_1^{s-1} + w_1^{s-1}$  $\eta \frac{\partial L}{\partial w_l}$  and for the bias weight vector of class l at time s would be  $b_l^s = b_l^{s-1} + b_l^{s-1}$  $\eta \frac{\partial L}{\partial b_1}$  for a certain learning factor  $\eta$  that can be determined empirically. following are the calculations of the various derivatives:
  - i.  $1=y_t$  $\frac{\partial L}{\partial w_{y_t}} = \frac{\partial}{\partial w_{y_t}} \ln(\sum_{j=1}^{\kappa} e^{w_j x_t + b_j}) - \frac{\partial}{\partial w_{y_t}} (w_{y_t} x_t - b_{y_t}) =$  $\frac{e^{w_{y_t}x_t+b_{y_t}}}{\sum_{i=1}^k e^{w_jx_t+b_j}}x_t-x_t$

$$\frac{\partial L}{\partial b_{y_t}} = \frac{\partial}{\partial b_{y_t}} \ln(\sum_{j=1}^k e^{w_j x_t + b_j}) - \frac{\partial}{\partial b_{y_t}} (w_{y_t} x_t - b_{y_t}) = \frac{e^{w_{y_t} x_t + b_{y_t}}}{\sum_{j=1}^k e^{w_j x_t + b_j}} - 1$$

ii. 1=i, where i represent any class different from  $y_t$ :

$$\frac{\partial L}{\partial w_{i}} = \frac{\partial}{\partial w_{i}} ln \left( \sum_{j=1}^{k} e^{w_{j}x_{t} + b_{j}} \right) - \frac{\partial}{\partial w_{i}} (w_{y_{t}}x_{t} - b_{y_{t}}) = \frac{e^{w_{i}x_{t} + b_{i}}}{\sum_{j=1}^{k} e^{w_{j}x_{t} + b_{j}}} x_{t}$$

$$\frac{\partial L}{\partial b_{i}} = \frac{\partial}{\partial b_{i}} ln \left( \sum_{j=1}^{k} e^{w_{j}x_{t} + b_{j}} \right) - \frac{\partial}{\partial b_{i}} (w_{y_{t}}x_{t} - b_{y_{t}}) = \frac{e^{w_{i}x_{t} + b_{i}}}{\sum_{j=1}^{k} e^{w_{j}x_{t} + b_{j}}}$$

2. following please find the practicle sections output graph, where the blue and red lines represents the actual and logistic regression trained probability functions, respectively, over 1000 samples between 0 to 10:
